

Project Summary: NYC Restaurant Inspection Analysis

Tools Used

- **Software:** Jupyter Notebook, GitHub
- **Python Packages:** Pandas (for data cleaning and aggregation), Matplotlib (for data visualization)

Questions Asked

- Which cuisine usually receives the highest inspection grades?
- Is there a correlation between a neighborhood's borough and its likelihood of not passing a health inspection?
- Are there hazardous zip codes where the density of violations is far higher than the city average?
- What are the most common health violations in New York City?

Insights Discovered

- Cuisines with simpler preparation (such as Salads and Donuts) have much higher "A" grade rates than complex cuisines.
- The borough of Queens has the highest likelihood of not passing an inspection (not receiving a grade below A), with Brooklyn and the Bronx in second and third place.
- The zip codes of 11419 and 11355 emerged as the most "hazardous," with roughly 13-14 violations per establishment. These zip codes contain a diverse group of immigrant communities, possibly indicating a lack of resources in neighborhoods.
- The most frequent citations are not for food quality, but for vermin control and sanitation of non-food surfaces.

Recommendations:

- The NYC Department of Health and Mental Hygiene should launch a task force for the 11419 and 11355 zip codes to address their high violation density.
- Educational workshops should be prioritized in Queens to help restaurant owners lower the failure rate to match Manhattan and Staten Island levels.

Future Work:

- Analyzing if large chains perform better than independent restaurants in high-violation zip codes.
- Investigating if vermin-related violations in high-violation zip codes spike during the summer.
